

FORMIT VALUE RANGE ECONOMY WITHOUT COMPROMISE

Engineering of late has gone through a difficult period with many industry sectors suffering from the slowdown in the economy. With plant equipment budgets getting ever tighter Formit has designed a range of machines to reflect this trend without compromising the quality of finished product.

THE FORMIT VALUE ROLLFORMER RANGE

Formit has introduced the new machine to cater for the market where the product may not warrant justifying a large complex machine.

The machine is a simple rollformer designed such that the machine will roll the desired section at a reasonable production rate. Producing a machine in this way means that the savings can be passed onto you, the customer.

Adjustable entry guides can be mounted prior to the rollforming head section. This guides material into the rollformer from the decoiler.

The machines are capable of rollforming many standard products from U-channels to C-channels in a wide range of widths to suit your requirements.

On the exit of the rollformer there are various styles of De-twist unit which can be mounted to take out any bow or twist which may be induced into the product during the forming process.

The rollformer is guarded by a box type mesh guard with a hinged door, for access to the rollforming head, the door is interlocked with the emergency stop circuit.

Though the machine is a value machine the important part, the tooling, is not. All Formit roll tooling is designed using Copra software ensuring accuracy of product & rolls which will be designed to last.

Controls

Controls for the Machine are housed in an appropriate control desk situated at the front of the line.
