

**Formit Roll Tooling
Better by Design**

FORMIT ROLL TOOLING

All Formit roll tooling is designed to the customers specific requirements using the industry standard in Rollforming simulation software “Copro” by DATA-M. Formit are also the exclusive U.K. agents for this software.

On any new tooling project Formit have the capability to fully simulate the forming process and thus fully optimise the roll tooling for best performance & wear.

It will also highlight on existing tooling problems with wear & heat build up due to excessive work being carried out on certain forming stations of non-simulated roll tooling. These problems with existing tooling can quickly be ironed out using the power of this revolutionary software.

Formit will work with you to optimise existing tooling sets and develop new ones.

With roll tooling designed using Copra Software, Development time on new tooling projects is kept to a minimum due to the simulation of the rollforming process before manufacture of the forming tools commences.
