

Refurbishment of Existing Rollformer

ROLLFORMER REFURBISHMENT

The rollformer was first completely stripped down & assessed. The old parts were then sent for steam cleaning and shot blasting & repainting.

The forming passes were then re-fitted with new roll shafts as the old shafts had become worn. New gears and bearings were also fitted to the machine.

Brand new forming tools designed & manufactured by Formit, were also fitted to the machine as part of the refurbishment process.

The rollformer was then reassembled on it's repainted base fabrication.

Formit also replaced the drive system (including the motor) to convert the machine from a fixed speed to variable speed machine.

All work undertaken as part of the refurbishment is engineered to new standard & is fully guaranteed.

Contact the FORMIT sales office to discuss your refurbishment requirements.
